

## HDFS Commands

### Overview

The File System (FS) shell includes various shell-like commands that directly interact with the Hadoop Distributed File System (HDFS) as well as other file systems that Hadoop supports, such as Local FS, HFTP FS, S3 FS, and others.

The FS shell is invoked by:

```
bin/hdfs dfs <args>
```

All FS shell commands take path URIs as arguments. The URI format is scheme://authority/path.

For HDFS the scheme is hdfs, and for the Local FS the scheme is file. The scheme and authority are optional. If not specified, the default scheme specified in the configuration is used. An HDFS file or directory such as /parent/child can be specified as hdfs://namenodehost/parent/child or simply as /parent/child (given that your configuration is set to point to hdfs://namenodehost).

Most of the commands in FS shell behave like corresponding Unix commands. Differences are described with each of the commands. Error information is sent to stderr and the output is sent to stdout.

### 1. **mkdir**

Usage: `hdfs dfs -mkdir <paths>`

Takes path uri's as argument and creates directories. The behavior is much like `unix mkdir -p` creating parent directories along the path.

Example:

- `hdfs dfs -mkdir /user/username/dir1`
- `hdfs dfs -mkdir hdfs://bigdata:8020/user/username/dir2`

### 2. **put**

Usage: `hdfs dfs -put hdfsdata.txt /user/username/dir1`

Copy single src, or multiple srcs from local file system to the destination file system. Also reads input from stdin and writes to destination file system.

Example:

- `hdfs dfs -put hdfsdata2.txt hdfsdata3.txt /user/username/dir1`
- `hdfs dfs -put - /user/username/dir1/hdfsdata5.txt`  
Reads the input from stdin.  
CTRL + D to terminate

### 3. **cat**

Usage: `hdfs dfs -cat URI [URI ...]`

Copies source paths to stdout.

Example:

- `hdfs dfs -cat /user/username/dir1/hdfsdata5.txt`
- `hdfs dfs -cat file:/home/username/file1/file1.txt  
/user/username/dir1/hdfsdata5.txt`

It will show both the local and hdfs file contents.

#### 4. **get**

Usage: `hdfs dfs -get [-ignorecrc] [-crc] <src> <localdst>`

Copy files to the local file system. Files that fail the CRC check may be copied with the `-ignorecrc` option. Files and CRCs may be copied using the `-crc` option.

Cyclic redundancy checking is a method of checking for errors in data that has been transmitted on a communications link (accidental changes to raw data).

Example:

- `hdfs dfs -get /user/username/dir1/hdfsdata5.txt  
hdfsdata_to_local_file1.txt`

#### 5. **rm**

Usage: `hdfs dfs -rm [-skipTrash] URI [URI ...]`

Delete files specified as args. Only deletes files. If the `-skipTrash` option is specified, the trash, if enabled, will be bypassed and the specified file(s) deleted immediately. This can be useful when it is necessary to delete files from an over-quota directory. Refer to `rmdir` for recursive deletes.

Example:

- `hdfs dfs -rm /user/username/dir1/hdfsdata4.txt._COPYING_`

Here we delete the file `hdfsdata4.txt._COPYING_`

## 6. **copyFromLocal**

Usage: `hdfs dfs -copyFromLocal <localsrc> URI`

Similar to *put* command, except that the source is restricted to a local file reference.

Example:

- `hdfs dfs -copyFromLocal file1/file1.txt /user/username/dir2`

Copy the local file `file1.txt` to hdfs in Directory `dir2`, the destination file name also will be the same as `file1.txt`

## 7. **copyToLocal**

Usage: `hdfs dfs -copyToLocal [-ignorecrc] [-crc] URI <localdst>`

Similar to *get* command, except that the destination is restricted to a local file reference.

Example:

- `hdfs dfs -copyToLocal /user/username/dir2/file1.txt file1/new.txt`

## 8. **cp**

Usage: `hdfs dfs -cp URI [URI ...] <dest>`

Copy files from source to destination. This command allows multiple sources as well in which case the destination must be a directory.

Example:

- `hdfs dfs -cp /user/username/dir1/data6.txt /user/username/dir2/newfile.txt`
- `hdfs dfs -cp /user/username/dir1/data6.txt /user/username/dir1/data7.txt /user/username/dir2`

We can copy multiple files at same time, but in this case we need to only provide the directory names.

## 9. `moveFromLocal`

Usage: `dfs -moveFromLocal <localsrc> <dst>`

Similar to *put* command, except that the source `localsrc` is deleted after it's copied.

Example:

- `hdfs dfs -moveFromLocal file1/file1.txt /user/username/dir2/movedfile.txt`

## 10. `mv`

Usage: `hdfs dfs -mv URI [URI ...] <dest>`

Moves files from source to destination. This command allows multiple sources as well in which case the destination needs to be a directory. Moving files across file systems is not permitted.

Example:

- `hdfs dfs -mv /user/username/dir2/movedfile.txt /user/username/dir1/movedfile.txt`

We can move multiple file also at the same time, in this case we need to provide the name of the directory only

A syntax of the command is given below.

- `hdfs dfs -mv /user/username/file1 /user/username/file2 /user/username/directoryname`

## 11. `ls`

Usage: `hdfs dfs -ls <args>`

For a file returns stat on the file with the following format:

permissions number\_of\_replicas userid groupid filesize  
modification\_date modification\_time filename

For a directory it returns list of its direct children as in unix. A directory is listed as:

permissions userid groupid modification\_date  
modification\_time dirname

Example:

- `hdfs dfs -ls /user/username/dir1`

## 12. `lsr`

Usage: `hdfs dfs -ls -R <args>`

Recursive version of `ls`. Similar to Unix `ls -R`.

Example:

- `hdfs dfs -ls -R /user/username/dir1`

## 13. `rmr`

Usage: `hdfs dfs -rm -r [-skipTrash] URI [URI ...]`

Recursive version of delete. The `rmr` command recursively deletes the directory and any content under it. If the `-skipTrash` option is specified, the trash, if enabled, will

be bypassed and the specified file(s) deleted immediately. This can be useful when it is necessary to delete files from an over-quota directory.

Example:

- `hdfs dfs -rm -r /user/username/dir3`

#### 14. **setrep**

Usage: `hdfs dfs -setrep [-R] <path>`

Changes the replication factor of a file. -R option is for recursively increasing the replication factor of files within a directory.

Example:

- `hdfs dfs -setrep 4 /user/username/dir1/data6.txt`  
Replication 4 set: /user/username/dir1/data6.txt

#### 15. **count**

Usage: `hdfs dfs -count [-q] <paths>`

Count the number of directories, files and bytes under the paths that match the specified file pattern.

The output columns with -count are:

DIR\_COUNT, FILE\_COUNT, CONTENT\_SIZE FILE\_NAME

Example:

- `hdfs dfs -count /user/username/dir1`

#### 16. **du**

Usage: `hdfs dfs -du [-s] [-h] URI [URI ...]`

Displays sizes of files and directories contained in the given directory or the length of a file in case it's just a file.

Options:

- The `-s` option will result in an aggregate summary of file lengths being displayed, rather than the individual files.
- The `-h` option will format file sizes in a "human-readable" fashion (e.g 64.0m instead of 67108864)

Example:

- `hdfs dfs -du /user/username/dir1`
- `hdfs dfs -du -s /user/username/dir1`
- `hdfs dfs -du -h /user/username/dir1`

#### 17. **tail**

Usage: `hdfs dfs -tail [-f] URI`

Displays last kilobyte of the file to stdout.

Example:

- `hdfs dfs -tail /user/username/dir1/hdfsdata.txt`

#### 18. **touchz**

Usage: `hdfs dfs -touchz URI [URI ...]`

Create a file of zero length.

Example:

- `hdfs dfs -touchz /user/username/dir1/create.txt`

### **Admin Commands:**

#### 19. **chgrp**

Usage: `hdfs dfs -chgrp [-R] GROUP URI [URI ...]`

Change group association of files. With -R, make the change recursively through the directory structure. The user must be the owner of files, or else a super-user.

#### 20. **chmod**

Usage: `hdfs dfs -chmod [-R] <MODE[,MODE]... | OCTALMODE> URI [URI ...]`

Change the permissions of files. With -R, make the change recursively through the directory structure. The user must be the owner of the file, or else a super-user.

#### 21. **chown**

Usage: `hdfs dfs -chown [-R] [OWNER][:[GROUP]] URI [URI ]`

Change the owner of files. With -R, make the change recursively through the directory structure. The user must be a super-user.

For Additional Information on above 3 commands, Refer
